### General Description

The HT70xxA-2 series devices are a set of three terminal low power voltage detectors implemented in CMOS technology. Each voltage detector in the series detects a particular fixed voltage ranging from 2.2V to 8.2V. The voltage detectors consist of a high-precision and low power consumption standard voltage source as well as a comparator, hysteresis circuit, and an output driver. CMOS technology ensures low power consumption.

Although designed primarily as fixed voltage detectors, these devices can be used with external components to detect user specified threshold voltages.

### Functional Description

The HT70xxA-2 series is a set of voltage detectors equipped with a high stability voltage reference which is connected to the negative input of a comparator denoted as  $V_{REF}$  in the following figure for NMOS output voltage detector.

When the voltage drop to the positive input of the comparator (i.e,  $V_B$ ) is higher than  $V_{REF}$ ,  $V_{OUT}$  goes high, M1 turns off, and  $V_B$  is expressed as  $V_{BH} = V_{DD} \times (R_B + R_C) / (R_A + R_B + R_C)$ . If  $V_{DD}$  is decreased so that  $V_B$  falls to a value less than  $V_{REF}$ , the comparator output inverts from high to low,  $V_{OUT}$  goes low,  $V_C$  is high, M1 turns on,  $R_C$  is bypassed, and  $V_B$  becomes:  $V_{BL} = V_{DD} \times R_B / (R_A + R_B)$ , which is less than  $V_{BH}$ . By so doing, the comparator output will stay low to prevent the circuit from oscillating when  $V_B \approx V_{REF}$ .

If  $V_{DD}$  falls below the minimum operating voltage, the output becomes undefined. When  $V_{DD}$  goes from low to  $V_{DD} \times R_B / (R_A + R_B) > V_{REF}$ , the comparator output and  $V_{OUT}$  goes high.

The detectable voltage is defined as:

$$V_{DET} (-) = (R_A + R_B + R_C) / (R_B + R_C) \times V_{REF}$$

The release voltage is defined as:

$$V_{DET} (+) = (R_A + R_B) / R_B \times V_{REF}$$

The hysteresis width is:

$$V_{HYS} = V_{DET} (+) - V_{DET} (-)$$

**NMOS Output Voltage Detector**

The figure demonstrates the NMOS output type with positive output polarity ( $V_{OUT}$  is normally open, active low). Application circuits shown are examples of positive output polarity (normally open, active low) unless otherwise specified.

## Application Circuits

### Microcomputer Reset Circuit

Normally a reset circuit is required to protect the microcomputer system from malfunctions due to power line interruptions. The following examples show how different output configurations perform a reset function in various systems.

- NMOS open drain output application for separate power supply

- NMOS open drain output application with R-C delay

### Power-on Reset Circuit

With several external components, the NMOS open drain type of the HT70xxA-2 series can be used to perform a power-on reset function as shown:

**5V Power Line Monitoring Circuit**

Generally, a minimum operating voltage of 4.5V is guaranteed in a 5V power line system. The HT7044A-2 is recommended for use as 5V power line monitoring circuit.

- 5V power line monitor with power-on reset

- with 5V voltage regulator

**Change of Detectable Voltage**

If the required voltage is not found in the standard product selection table, it is possible to change it by using external resistance dividers or diodes.

- Varying the detectable voltage with a resistance divider

Detectable voltage =  $(R_A + R_B) / R_B \times V_{DET}$

Hysteresis width =  $(R_A + R_B) / R_B \times V_{HYS}$

- Varying the detectable voltage with a diode

Detectable voltage =  $V_{f1} + V_{f2} + V_{DET}$

**Malfunction Analysis**

The following circuit demonstrates the way a circuit analyzes malfunctions by monitoring the variation or spike noise of power supply voltage.

**Charge Monitoring Circuit**

The following circuit shows a charged monitor for protection against battery deterioration by overcharging. When the voltage of the battery is higher than the set detectable voltage, the transistor turns on to bypass the charge current, protecting the battery from overcharging.

**Level Selector**

The following diagram illustrates a logic level selector.
